

<b>Name</b>	<b>Delphi survey</b>
<b>Methodology</b>	<p>The Delphi survey is an iterative method for finding consensus. It runs through three main stages, that can be repeated until a consensus base is reached.</p> <ul style="list-style-type: none"> <li>• First, the group facilitator selects a number of experts based on the topic.</li> <li>• Once all participants are confirmed, each member of the group receives a questionnaire with instructions to comment based on personal opinion, experience, or previous research.</li> <li>• The questionnaires are returned to the facilitator who groups the comments and summarizes the information into a single document.</li> </ul> <p>At the end of each comment session, the facilitator decides if another round is necessary based on conflicting opinions from participants; the questionnaire rounds can be repeated as many times as necessary to achieve a general sense of consensus.</p>
